

Architecture Discovery Consolidation Prompt

We have completed an architecture discovery cycle using `grill-with-docs`.

Do **not** ask another architecture question yet.

Your objective is to consolidate the current architecture before continuing discovery.

Responsibilities

Perform the following tasks in order.

1. Architecture Consistency Review

Review every architecture artifact.

Identify:

- contradictions
- duplicated concepts
- inconsistent terminology
- overlapping ADRs
- obsolete statements
- hidden assumptions
- undefined relationships
- architectural drift introduced during discovery

Do not silently modify architectural decisions.

Instead:

- explain the inconsistency
- recommend a resolution
- identify which ADR(s) are impacted

2. ADR Review

Review every Candidate ADR.

For each ADR:

- summarize its purpose
- identify dependencies on other ADRs

- identify any contradictions
- identify any superseded statements
- verify terminology matches the glossary

Do **not** change ADR status.

All ADRs remain:

Status: Proposed

3. Domain Model

Update the Domain Model.

The Domain Model must contain:

- entities
- relationships
- ownership
- lifecycles
- invariants
- extension points
- event flow

Do not introduce new concepts.

The Domain Model is a consolidation artifact, not a design artifact.

4. Glossary Review

Review the glossary.

Ensure:

- every architectural term has exactly one definition
 - retired terminology is listed only under "Avoid"
 - no synonyms remain
 - every ADR uses glossary terminology consistently
-

5. Architecture Discovery Brief

Review the Architecture Discovery Brief.

Do not rewrite history.

Instead:

- identify obsolete assumptions
- add a "Current Status" section
- reference Candidate ADRs where the architecture has evolved

The brief remains a discovery document.

It is **not** the specification.

6. Repository Review

Review the proposed repository changes.

Confirm:

- architecture artifacts only
- no implementation files
- no generated code
- no production configuration
- no secrets
- no environmental assumptions

List every file that will change.

7. Pull Request Review

Prepare—but do not create—a Pull Request.

Provide:

- Branch name
- Commit summary
- Pull Request title
- Pull Request description
- Files changed
- Review checklist

Do not commit.

Do not push.

Do not open the Pull Request.

Wait for approval.

8. Discovery Status

Determine whether architecture discovery has reached one of the following states.

- Continue Discovery
- Architecture Baseline Established
- Ready for Specification
- Ready for Implementation

Explain your reasoning.

If additional architecture discovery is recommended, identify only the remaining architectural questions.

Do **not** ask them yet.

Constraints

Do not:

- write implementation code
- generate schemas
- create APIs
- produce tickets
- accept Candidate ADRs
- begin specification
- continue `grill-with-docs`

Your objective is to produce a clean, internally consistent architectural baseline.

Only after the baseline has been reviewed and approved should architecture discovery continue or the project transition to `to-spec`.
